When natural gas is burned, water vapor is produced. This vapor contains heat. If it can be condensed, latent heat will be given off. The dew point temperature (DPT) is the temp that the condensation process begins. In flue gas, the DPT varies depending on the composition of the flue gas and the amount of excess air. pg 744

The pilot flame engulfs a thermocouple. The heat from the flame produces a small DC voltage. If the pilot flame is ever lost, the DC current will stop flowing to a power unit that is holding the safety shutoff open. When the power unit is de-energized, it will shut the valve and gas flow will stop.

Dilution air is air added after combustion. Usually enters at the end of the heat exchanger. It is brought in by the draft hood of the furnace. When excess air decreases, the Dew Point Temperature increases. The Dew Point Temperature for the undiluted flue gas is around 140 degrees F in the flue gas.
